

PROJECT PROPOSAL

8-Jasmine

Aguirre, Hilario, Remojo

TITLE:

POCKETBUDGET

Problem Statement:

Most high school students struggle to manage their money because adult budgeting apps can be too complicated for managing simple weekly allowances. Students may have difficulty keeping track of their spending and knowing how much money they have left.

Objectives:

Our Python program will track weekly allowance, record money spent on lunch and school stuff, show the remaining balance, and save the information to a file.

Proposed Feature:

The app includes an allowance logger, expense tracker, live balance counter, and automatic file storage to help students manage their money.

Project Methodology:

Build the app using standard software development steps by gathering student needs, designing the menu flow, writing Python functions with file operations, testing for accurate calculations, and sharing the final script.

Planned Inputs:

The user types weekly allowance amounts, purchase item names, item costs, and simple menu choice numbers into the terminal using standard keyboard prompts.

Planned Outputs:

The program displays printed text messages showing the remaining money, lists of past expenses, and saved text entries inside a local file.

Logic Plan:
